7. Voluntary problem set: Finite automata

These problems are completely **voluntary** (no bonus points given, either) that one may solve, for instance, before the exam to practise the constructions.

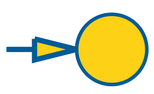
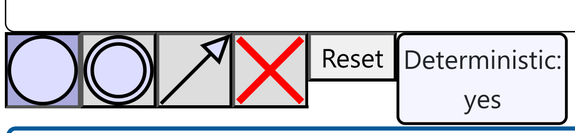
Exercise description My submissions **0 / 50**

Designing an NFA for a language

Consider the language $L = \{w \in \{0,1\}* \mid w \text{ contains the substring } 1010 \text{ or } 0101 \text{ (or both)}\}$.

Design a non-deterministic finite automaton (NFA) that recognises the language. ε-transitions are allowed.





- Click on the canvas to add new states.
- You can also move existing states by dragging them.
- Click on transition labels to edit them.
